

## Swing Carriages

Swing Carriage - The load capacity of a lift truck jib has a maximum of roughly 1935 lbs up to 6000 pounds on either the retracted or extended positions range. You might need to discuss with a material handling specialist about the particular limits of your lift truck use. The load capacity rankings are intended for the jib itself and not the forklift or even the maximum load that could be transferred securely with a certain forklift. It is essential to bear in mind that at any time when whatever attachments like a lift truck jib are added to the lift truck, the new center of gravity made by the accessory would reduce the overall lift capability of the forklift. There are guidelines obtainable that offer details on the way to properly determine these load limits.

Previous to making use of a lift truck jib, make certain that it is properly secured to the lift truck with the use of hooks and shackles. Always make sure so as to verify that the screw pins are tight. It is very important to also double check that the weight calculations have been made properly. Bear in mind to take into consideration the truth that rated capacities sometimes lessen when the boom is in an elevated position, every time the boom is fully extended with telehandlers or even every time the mast is tilted forward.

Some important suggestions regarding the adjustable jib are: do not ever pull a load making use of a forklift jib attachment, as these types of attachments are actually used for vertical lift only. At all times lift the load without letting it swing. Use extreme caution each time a load is carried to be able to prevent tipping over the truck.
